

TEMPERATURE SENSORS

PYRO-CONTÔLE, a leading French provider of temperature sensors for industrial us, joined Chauvin Arnoux in 1997, affording it access to the Group's six Research & Development centres, as well as an international sales network handled by ten subsidiaries in Europe, the United States and China.

Located near Lyon, in the south of France, the **PYRO-CONTÔLE** industrial site designs, manufactures and markets temperature sensors and industrial temperature measurement and control systems.

From tailor-made to production line products, **PYRO-CONTÔLE** can adapt to the specific requirements of each customer, and is able to cater for all temperature measurement needs thanks to its **mastery of the entire temperature process loop**.

The company's scope of intervention covers demanding process industries, such as the chemical, petrochemical, glass, ceramics, metallurgy and nuclear sectors.

PYRO-CONTÔLE received version 2000 ISO 9001 certification for its entire quality system and also has COFRAC n° 2-1385 accreditation for temperature metrology from -20 °C to +1,550 °C.

The **CHAUVIN ARNOUX GROUP** is a European market leader in the measurement sector and proposes a comprehensive product offering with its three companies: **PYRO-CONTÔLE**, **ENERDIS** and **CHAUVIN ARNOUX Test & Measurement**. It also provides a services offering with the **MANUMESURE** company.

In this catalogue

► Define your sensor in as little as 2 or 3 stages. 3 criteria:

- Type of output (head, connector, cable)
- Type of sensing element (RTD 100 Ω, TC J, TC K)
- Temperature resistance

or: Type of application

or: Components, replacements and accessories

► 1,200 standard temperature sensor references

► Fast delivery

For any other requirements, consult our product listing at: www.pyro-controle.com

► Specialised temperature sensors per application

For each application, a complete offer of specialised sensor:
chemicals - glass - metallurgy - plastics - agri-food - pharmacy - etc.

► Customised temperature sensors

Define your requirements and contact us

Technical terms used in temperature metrology

Cold junction (reference junction):

Junction whose known temperature is used as measuring reference (theoretically at 0 °C, measured practically).

Compensation cable:

Cable consisting of conductors that are different to those of the thermoelectric couple, but with similar thermoelectric specifications, so as to render errors resulting from its use negligible for a given temperature range.

By convention, the temperature to which the junctions and elements of the thermoelectric couple/compensation conductor are exposed is limited to 200 °C, so as to ensure that the electromotive force developed in the two compensation conductors is equal to that developed by the thermoelectric couple at the same temperature.

Consistency of a sensor:

Quality characterising the aptitude of a sensor, for a given value of the quantity to be measured, to provide readings that are consistent, without taking systematic errors into consideration.

Extension cable:

Cable consisting of conductors of the same nature as the elements of the thermoelectric couple and which extends this to the thermocouple's reference junction.

Hot junction (measurement junction):

Junction placed at point at which the temperature is to be measured.

Insulated thermoelectric couple:

Thermoelectric couple whose elements are electrically insulated from one another elsewhere than at their junction.

Insulation resistance:

Electrical resistance between the sensing element and adjoining conductive parts, be they part of the sensor itself or of its environment. Its value depends on the conditions of use, and in particular on the temperature.

Interchangeability of sensor:

Quality characterising the aptitude of a sensor to replace another sensor, without altering the performances of a measuring device.

International temperature scale (ITS):

We differentiate between:

- the International Practical Kelvin Temperature: T_{90} .

Unit: Kelvin, symbol: K.

and

- the International Practical Celsius Temperature t_{90} .

Unit: degree Celsius, symbol: °C.

Both temperatures being linked by the expression:

$$t_{90} = T_{90} - 273,16K$$

The **Kelvin** is equal to 1/273.16 of the thermodynamic temperature of the triple point of water.

The ITS 90 is based on the temperature values assigned to a certain number of reproducible states of equilibrium (fixed points) and for specified instruments calibrated at these temperatures.

Interpolation between the temperatures of the fixed points is calculated using formulae that define the relationship

between the readings of these instruments and the values of the International Temperature Scale.

Joule effect:

All conductors through which a current passes are subject to heating known as the Joule effect.

Measurement line:

The measurement of a physical quantity implies not only the use of a sensor, but also a measuring instrument. The measurement line is the line of transducing elements and linking devices of the measuring instrument placed between the sensor - first element of the line - and the indicator device, which is the last element of the line (see measurement transducer).

Measurement range:

Algebraic difference between the extreme values read for the quantity to be measured and for which the metrological specifications of the sensor defined elsewhere are guaranteed. The unit is that of the quantity to be measured.

Reference table:

Table for linking the sensor output reading to the value of the quantity to be measured.

With the reference junction of a couple being maintained at 0 °C, the electromotive force it delivers when its measurement junction is brought to a temperature t is specific to the couple and the temperature.

For each type of thermoelectric couple, E.M.F./temperature reference tables are established which enable the temperature t to be deduced from the E.M.F. measured and vice versa.

Repeatability:

For each value of the quantity to be measured, there exist two sensor reading values depending on whether the value has been obtained by a rising or falling variation. The repeatability rating is equal to the maximum difference observed between these two values for a given measurement range.

Resistance/temperature variation law:

The fundamental values of platinum measurement resistances for the measurement ranges 0 to 850 °C and -200 °C to 0 °C are determined on the basis of the following interpolation functions: (Values based on ITS 90.):

$$R(t)-R_0 (1 + At + Bt^2) \quad \text{from } 0^\circ\text{C to } 850^\circ\text{C}$$

$$R(t) = R_0 [1 + At + Bt^2 + Ct^3 (t-100)] \quad \text{from } -200^\circ\text{C to } +0^\circ\text{C}$$

$$A = 3.9083 \times 10^{-3} \text{ } ^\circ\text{C}^{-1}$$

$$B = -5.775 \times 10^{-7} \text{ } ^\circ\text{C}^{-2}$$

$$C = -4.183 \times 10^{-12} \text{ } ^\circ\text{C}^{-3}$$

Resistivity:

At constant temperature, the resistivity of a metal conductor of given length and cross-section is a characteristic of the material itself and depends on its nature. It is expressed in ohm-m.

$$\rho = R \times S / L$$

ρ = resistivity of material ($\Omega \cdot m$)

R = resistivity measured (Ω)

S = cross-section of conductor (m^2)

L = length of conductor (m)

Resolution:

The smallest perceptible variation in the information provided by a measuring instrument in reference conditions. For a resistance thermometer, the resolution is the limit towards which the ratio ΔR tends when Δt tends towards 0.

Seebeck effect (or Thermoelectric effect):

The Seebeck effect is the phenomenon resulting from the production of an electrical current in a circuit composed of two conductors of different natures whose junctions are placed at two different temperatures.

Self-heating:

Self-heating of temperature sensor due to current passing through it. Depends on conditions in which sensor is used, especially the specifications of its immediate environment. Measured in degrees per Watt: $^{\circ}\text{C}.\text{W}^{-1}$.

Self-heating coefficient:

The intensity I of a current passing through a sensing element of resistance R . The power produced by the Joule effect ($P = R.I^2$) raises the temperature of the sensor by Δt ; The self-heating coefficient is defined by:

$$K = \Delta t / P$$

K is expressed in degrees per Watt: $^{\circ}\text{C}.\text{W}^{-1}$

Sensitivity:

For a given value of the quantity measured, the sensitivity is expressed by the quotient of the variable increase observed by the corresponding increase for the value measured.

Example:

For a resistance thermometer: $\Delta R / \Delta t$

For a thermoelectric couple: $\Delta E / \Delta t$

Sensor:

Element of measuring instrument used for registering data relating to the quantity to be measured, consisting of a test body (if there is one) and a sensing element.

Sensor response deviation:

For a given value of the quantity to be measured, the response deviation is the difference between the sensor output reading and the standard true value given in the reference table by a recognised standard or theoretical law.

Sheathed thermoelectric couple:

Thermoelectric couple immersed in an isolating mineral and compacted inside a metal sheath that is both pliable and watertight.

Temperature coefficient:

Average value of variation in resistance between 0 and 100 $^{\circ}\text{C}$, given by the following:

$$\alpha_{100} = (R_{100} - R_0) / 100 \times R_0$$

R_0 and R_{100} being respectively the values of the resistance at 0 and at 100 $^{\circ}\text{C}$, α is expressed in $^{\circ}\text{C}^{-1}$

Temperature:

By uniting two identical bodies at the same temperature, a new body is obtained whose mass and volume have doubled, but whose temperature remains unchanged.

While it is possible, therefore, to define the equality of two temperatures, it is impossible to define their addition.

Temperature strictly speaking therefore cannot be measured, but only read according to an established system. In thermodynamic terms, it is possible to specify what the quantity "temperature" represents by defining it according to the Carnot principle.

Under such conditions, the thermodynamic "temperature" is expressed with respect to a unit of the property considered and not, as is usually the case, with respect to a scale.

Thermal conduction:

Conduction occurs when materials--especially solids--are in direct contact with each other. Heat conduction is the transfer of energy (heat transfer) from more energetic to less energetic particles due to some form of interaction between these particles.

Thermal convection:

Convection is transfer of heat when a fluid is in motion. Convection involves a transfer of thermal energy by microscopic particle-particle interaction and bulk motion of the fluid, for which the particles are all moving together.

Thermal insulation:

Normally, heat is transferred by from one material to another by conduction, convection and/or radiation. Insulators are used to minimize that transfer of heat energy.

Thermoelectric couple:

Unit consisting of two homogeneous conductors of different natures, joined at their extremities and developing an electromotive force by the Seebeck effect, dependent on the temperatures of their junctions.

In practice, a thermoelectric couple is composed of two conductive elements joined at one of their extremities, with the other extremity connected to a measuring instrument.

Thermometric/pyrometer assembly:

Unit composed of the sensing element (thermometric element, thermoelectric couple), its electrical insulation and (where this exists) protective casing.

A thermometric rod is equipped with electrical connection devices (connectors, wiring, terminals, etc.) and mechanical fittings.

Time constant of a sensor:

The response of a sensor to a given temperature interval corresponds more often than not to an exponential distribution with the form:

$$S(t) = S_1 + (S_2 - S_1)(1 - \exp(-t/\tau))$$

$S(t)$ sensor output temperature reading

S_1 sensor output reading corresponding to the initial temperature value

S_2 sensor output reading corresponding to the final temperature value

τ time constant

The time constant is the response time at 63 %, where the reaction time of the sensor is considered negligible.

Radiation transfer:

Hot and even warm objects radiate infrared electromagnetic waves, which can heat up objects at a distance, as well as lose energy themselves. The use of reflective materials usually provides insulation against heat transfer by radiation.

Deciding factors when choosing a temperature sensor

Number of sensing elements

Simple or duplex: simple in the case of a single sensing element, duplex when two sensing elements are necessary, e.g. for redundancy (measurement reliability) or different uses (one for measuring, one for display).

Temperature ranges

Type of resistance	Temperature range		Atmosphere
RTD 100 Ω	-200 / +600 °C		Average oxidising
Type of thermocouple	Code	Temperature range	Atmosphere
Cu – CuNi	T	-20 / +350 °C	Average oxidising or reducing
Fe – CuNi	J	-20 / +760 °C	Reducing, limited use in oxidising atm.
NiCr - Ni alloy	K	-40 / +1,100 °C	Clean oxidising and inert
Nicrosil – Nisil	N	0 / 1,100 °C	Clean oxidising, limited use in reducing atm.
Pt - PtRh 13 %	R	0 / 1,600 °C	Oxidising
Pt - PtRh 10 %	S	0 / 1,550 °C	Oxidising
PtRh 6 % - PtRh 30 %	B	100 / 1,600 °C	Oxidising
Tungsten(W) Rhenium (Re)	W/Re	0 / 2,300 °C	Reducing, inert, hydrogenous

In theory, **RTD 100 Ωs** withstand temperatures of up to 600 °C, but for commonly-used sensors, **450 °C is the recommended upper limit**.

The performance of sheathed thermocouples is directly related to their diameter, in relation to the temperature at which they are used.

Maximum operating temperatures for sheathed thermocouples:

Ø TCG	J, stainless steel sheathed	K, inconel 600 sheathed
0.5 mm	250 °C	350 °C
1 mm	300 °C	400 °C
2 mm	300 °C	500 °C
3 mm	450 °C	750 °C
4.5 mm	450 °C	1000 °C
6 mm	600 °C	1100 °C
8 mm	600 °C	1100 °C

These maximum operating temperatures are for information purposes. Operating conditions (oxidising or reducing atmosphere, thermal cycling, etc.) can alter these characteristics.

Particular attention should be paid to drift, which is sometimes quite high for thermocouples (pollution and metallurgical diffusion at the hot spot).

Regular calibration may be appropriate.

Accuracy range

Type of sensing element: see interchangeability tolerance levels in the following chapters, devoted to RTD 100 Ω and thermocouples.

For cable output thermocouples, see extension and compensation cable tolerance levels table in the following chapter devoted to thermocouples.

Calibration: for desired accuracy lower than interchangeability level, it is necessary to carry out a calibration that enables (allowing for uncertainty) the actual difference between the measurement indicated by the sensor and the actual temperature to be defined.

Dimensions

Naturally, external dimensions must not be overlooked: length and diameter.

Electrical connection

Electrical connection is achieved using a head (connection to a terminal block or a transmitter), a connector or a cable. For RTD 100 Ωs: see connection table in the following chapter devoted to RTD 100 Ωs.

For thermocouples: see connection table in the following chapter devoted to thermocouples.

Heads, connectors and cables have upper operational temperature limits depending on the materials used:

MA Type connection head:	100 °C	Thermocouple connectors:	220 °C (*)
PM Type connection head:	150 °C (*)	PVC sheathed cable or wires:	100 °C
Din B Type connection head:	100 °C	Silicone, FEP or PTFE sheathed cable or wires:	200 °C (*)
Connection head with transmitter (DAN type):	85 °C	Fiberglass sheathed cable or wires:	250 °C (*)
RTD 100 Ω connectors:	100 °C		

(*): in practice, it is advisable never to exceed 100 °C to accommodate insulation components that may be used in the connection, such as araldite glue.

Dynamics of the process

The response time must correspond to the dynamics of the process and the ultimate use of the measurement. The principle of measuring response times is described in the IEC 751 standard.

63 % response time of standard TCG sensors depending on diameter:

Diameter	0.5 mm	1 mm	1.5 mm	2 mm	3 mm	4.5 mm	6 mm	8 mm
TCG J or K*	0.3 s	0.4 s	0.6 s	0.9 s	1.5 s	2 s	4 s	7 s

(*) with isolated hot welding

Abrasion, corrosion and pressure

The protective materials must be adapted to suit operating conditions, especially abrasion and corrosion.

For pressure vessels, the definition rules must include compliance with the PED Directive (see following page).

Vibrations

The construction around the sensing element must be particularly robust in the likelihood of severe vibration conditions.

Connection to process

Plan what you will use to attach the sensor to the process: flange, connector, adjustable compression fitting, etc.

The resistance of adjustable compression fittings to pressure depends on several factors: material comprising the ferrule is, diameter and temperature, and type of protection (tube or sheathed cable).

The table below displays the characteristic of maximum operating pressure values.

Type of adjustable compression fitting	Type of ferrule	Type of sensor	Operating temperature	Ø 3 mm	Ø 4.5 mm	Ø 6 mm	Ø 8 mm
Stainless steel	Stainless steel	RTD100	20 °C	300 bar	400 bar	300 bar	400 bar
			450 °C	170 bar	220 bar	170 bar	220 bar
Stainless steel	Stainless steel	TCG	20 °C	500 bar	500 bar	500 bar	500 bar
			450 °C	250 bar	250 bar	250 bar	250 bar
Stainless steel	PTFE	RTD100 and TCG	20 °C	5 bar	5 bar	5 bar	5 bar

Communication

Format of the output quantity (analogue, digital, communication protocol).

In the case of digital or analogue outputs, transmitter at connection head.

Environment

Compliance with applicable European Standards and Directives. See table on the following page.

Applicable European Directives

The **ATEX 94/9/CE Directive** applies to equipment in explosive atmospheres.

Temperature measurements in explosive zones are subject to this directive.

Our Production Quality Assurance Notification is certified by INERIS (French National Institute for Industrial Environment and Risks) under the no. **INERIS 03 ATEX Q402**.

Our **NT96-03** documentation presents the consequences of the application of this directive for our measuring instruments.

The **97/23/CE Pressure Equipment Directive** applies to pressurised equipment and so, naturally, to temperature sensor protectors such as bored wells, which are part of the envelope.

However, sensors do not come under the Pressure Equipment Directive.

Our **NT96-02** documentation presents the consequences of the application of this directive for our measuring instruments.

The **CEM 89/336 Directive** applies to electrical or electronic equipment that can transmit or be disturbed by electromagnetic waves.

Our in-head transmitters comply with **Emissions** standard **EN50 081-1** and **Receivers** standard **EN50 082-2**.

Applicable Standards

Electrical material for explosive atmospheres

EN 50014	General Rules
EN 50015	Immersion in oil
EN 50016	Internal overpressure
EN 50017	Pulverulent filling
EN 50018	Explosion proof envelope
EN 50019	Increased safety "e"
EN 50020	Intrinsic safety "i"

RTD 100 Ω Sensors

The relationship between resistance and temperature, and the corresponding tolerances, are defined by European standards IEC 751.

We distinguish two technology types:

- **platinum resistance thermometers with platinum wire wound on an insulating support.** The latter is usually ceramic but can sometimes be glass. Operating temperatures range up to 450 °C, and in exceptional cases up to 850 °C. These sensing elements provide higher accuracy and greater stability.
- **platinum coating on a ceramic base.** Operating temperatures range up to 450 °C. Although these are less stable than conventional winding elements, they provide greater resistance to vibrations up to 200 °C, a shorter response time and a lower cost.

Other materials have characteristic temperature laws: Copper and Nickel (less and less frequently used).

IEC 751 reference table (excerpts): temperature and resistance

°C ITS 90	Ω								
-200	18.52	10	103.90	210	179.53	410	250.53	610	316.92
-190	22.83	20	107.79	220	183.19	420	253.96	620	320.12
-180	27.10	30	111.67	230	186.84	430	257.38	630	323.30
-170	31.34	40	115.54	240	190.47	440	260.78	640	326.48

-10	96.09	200	175.86	400	247.09	600	313.71	800	375.70
0	100.00							810	378.68
								820	381.65
								830	384.60
								840	387.55
								850	390.48

Tolerance class

The standard IEC 751 defines interchangeability tolerances as follows:

Tolerance class	Tolerance
A	$0.15 + 0.002 \times [t]$
B	$0.3 + 0.005 \times [t]$

where $[t]$ is the absolute value of the temperature in °C

According to this standard, the tolerance class A cannot be applied to thermometers exposed to temperatures exceeding 650 °C.

According to our experience, we recommend limiting RTD 100 Ω industrial sensors to 450 °C for Class A tolerance.

RTD 100 Ω Sensors

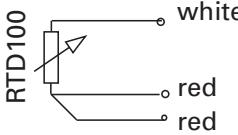

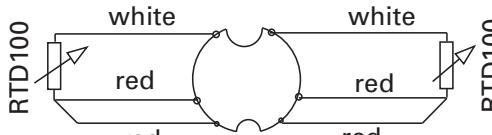

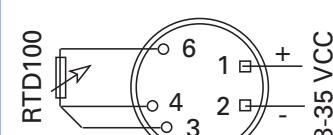

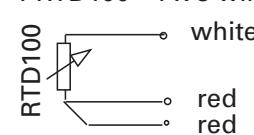

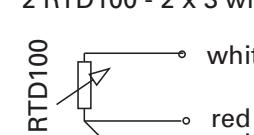

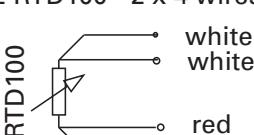

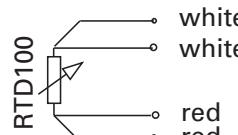

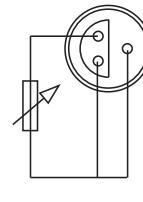

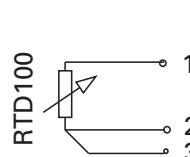

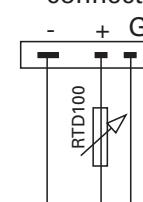

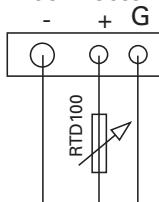

Tolerance classes for RTD 100 Ω:

Temperature (°C)	Tolerance			
	Class A		Class B	
	(+/- °C)	(+/- Ω)	(+/- °C)	(+/- Ω)
-200	0.55	0.24	1.30	0.56
-100	0.35	0.14	0.80	0.32
0	0.15	0.06	0.30	0.12
100	0.35	0.13	0.80	0.30
200	0.55	0.20	1.30	0.48
300	0.75	0.27	1.80	0.64
400	0.95	0.33	2.30	0.79
500	1.15	0.38	2.80	0.93
600	1.35	0.43	3.30	1.06
650	1.45	0.46	3.60	1.13

Class A/2: tolerance at 0 °C is divided by 2. Curve parallel to Class A. Tolerance: $0.075 + 0.002 \times t$

Class A/5: tolerance at 0 °C is divided by 5. Curve parallel to Class A. Tolerance: $0.003 + 0.002 \times t$

Thermocouple sensors

The sensor consists of two wires welded at the hot junction of the thermoelectric couple; readings are made at the cold junction, which must be compensated to simulate 0 °C.
Various materials are used to make the thermocouples.

Thermoelectric force and tolerances are determined in compliance with the IEC 584 standard.

IEC 584 Reference Tables (excerpts): temperature and voltage in mV

Temperature	Type of thermocouple							ASTM E988 WRe 3 % -25 %	
	IEC 584								
	T	J	K	N	R	S	B		
-40 °C	-1.475	-1.960	-1.527	-1.023	-0.188	-0.194			
0 °C	0	0	0	0	0	0	0	0	
50 °C	2.036	2.585	2.023	1.340	0.296	0.299	0.002	0.528	
100 °C	4.279	5.269	4.096	2.774	0.647	0.646	0.033	1.145	
150 °C	6.704	8.010	6.138	4.302	1.041	1.029	0.092	1.841	
200 °C	9.288	10.779	8.138	5.913	1.469	1.441	0.178	2.603

Tolerance Class

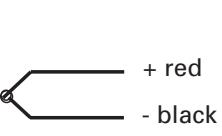

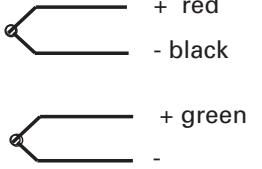

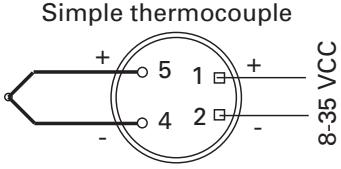

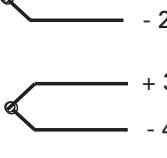

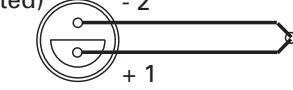

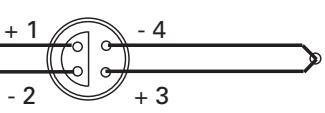

Type of TC	Tolerance class		Temperature range of cable	Temperature of measurement junction
	1	2		
JX	+/- 1.5 °C	+/- 2.5 °C	-25 °C to +200 °C	300 °C
TX	+/- 0.5 °C	+/- 1.0 °C	-25 °C to +100 °C	500 °C
EX	+/- 1.5 °C	+/- 2.5 °C	-25 °C to +200 °C	900 °C
KX	+/- 1.5 °C	+/- 2.5 °C	-25 °C to +200 °C	900 °C
NX	+/- 1.5 °C	+/- 2.5 °C	-25 °C to +200 °C	900 °C
KCA		+/- 2.5 °C	0 °C to +150 °C	900 °C
KCB		+/- 2.5 °C	0 °C to +100 °C	900 °C
NC		+/- 2.5 °C	0 °C to +150 °C	1000 °C
RCA		+/- 2.5 °C	0 °C to +100 °C	1000 °C
RCB		+/- 5.0 °C	0 °C to +200 °C	1000 °C
SCA		+/- 2.5 °C	0 °C to +100 °C	1000 °C
SCB		+/- 5.0 °C	0 °C to +200 °C	

Note: A cable made up of two copper conductors can be used with B type thermocouples.

The maximum extra deviation possible for the cable temperature range between 0 °C and 100 °C is 40 µV.

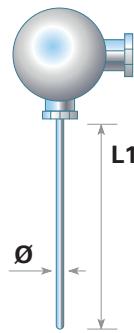

The equivalent temperature difference is 3.5 °C, when the temperature of the thermocouple junction is 1,400 °C.

Description:

- RTD 100 Ω probe, class A, complies with NF EN 60751 standard
available in: simple or duplex
- 316L stainless steel protective sheathing, 6 mm diameter
available in: L1 length
- DIN format head connection, IP54 protection
available in: MA, PM, DIN B or DAN
 - Electrical connection to terminal block: MA, PM and DIN B
 - Connection to linearised 4-20 mA output transmitter: DAN
 - PE9, PE11 or PE16 cable gland, depending on model (see p. 48)

*Sensors with transmitters: indicate temperature range, default 0-500 °C

Description:

- K type thermocouple, sheathed, in compliance with NF EN 61615 standard insulated hot junction.
- available in: simple (1 TC) and duplex (2 TCs)
- Protective Inconel 600 sheathing
- available in: L1 length and Ø
- DIN format G1/2 fitting, IP54 protection
- available in: DIN B and DAN
 - Connection to terminal block: DIN B
 - Connection to linearised 4-20 mA output transmitter: DAN
 - PE16 cable gland (see p. 48)
- Connection via G1/2 fitting, G 1/2 threading
- Withstands temperatures up to 1,100 °C
Heat resistance decreases with diameter (see p. 6)

Description:

- J type thermocouple, sheathed, in compliance with NF EN 61615 standard insulated hot junction. Simple (1 TC)
- 304L protective stainless steel sheathing available in: L1 length and Ø
- Miniature male connector
- Withstands temperatures up to 300 °C
Heat resistance decreases with diameter (see p. 6)

Other types of electrical connection: see electrical connection

Description:

- Compensation cables for J and K type thermocouples, simple or duplex
- Extension cables for RTD 100 Ω, with 3-wire connection, simple
- PVC coated conductors, with conductive braid and PVC external sheathing. Length: 2 m
- Extension cable terminations
 - available in:** male/female connectors, male connector/naked wire, female connector/naked wire
- Types of connectors
 - available in:** Standard, Miniature, Lemo or Jaeger
 - Connectors for thermocouples are compensated

Surface RTD 100 Ω sensing element, attached with adhesive, cable or wire output

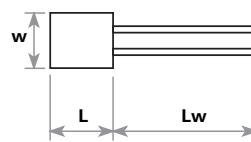

- Flat, flexible, RTD 100 Ω sensing element, class B, in compliance with NF EN 60751 standard. Attached with adhesive
 - coating: Silicon-Elastomer
 - output: 1 x 4 wires, silver-plated copper, 0.055 mm² section, PTFE insulated
 - operating temperature: -70 °C to +200 °C

Dimensions (w x L)	Thickness	Code
10 x 23 mm	1.5 mm	L061822-000

- coating: adhesive fiberglass
- output: 2 silver wires
- operating temperature: -80 °C to +250 °C

Dimensions (w x L)	Thickness	Length of Lw wire	Code
20 x 20 mm	0.8 mm	40 mm	L061300-000
12 x 10 mm	0.8 mm	20 mm	L062300-000

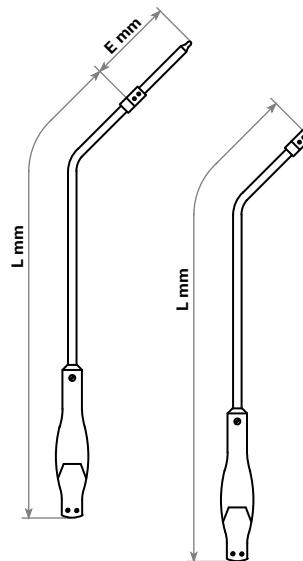

Portable assembly for measurements in aluminium foundries

Description:

- Consisting of a measurement lance with handle and an interchangeable K thermocouple sensing element

To order, select a measurement lance and the K thermocouple sensing element that goes with it. Spare sensing elements are available in packs of 5.

Measurement lance

Description:

- Stainless steel tube with 45° curved termination
- Plastic handle
- Designed for quick fixing of sensing elements with two screws

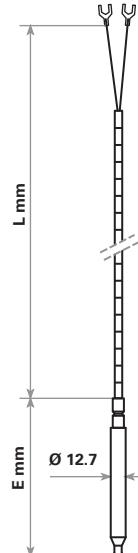

L (mm)	Code
785	L018900-000
1100	L018906-000
1400	L018904-000

Sensing element

Description:

- K thermocouple in compliance with NF EN 61515 standard
 - 12.7 mm Ø chromite protective sheathing, termination swaged to 6.8 mm Ø
 - Compensation cable output for KTC, insulated with ceramic beads, fiberglass sheathing, terminations equipped with connection lug

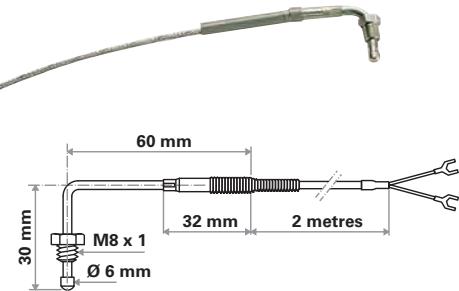

E (mm)	For lance L = 785 mm	For lance L = 1100 mm	For lance L = 1400 mm

Double slot bayonet	Code
TF5 - J type thermocouple, grounded hot junction on 5 x 30 mm Ø rounded end with double slot bayonet (10.6 mm int. Ø), spring-loaded (5 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602905
TF5R - J type thermocouple, grounded hot junction on 5 Ø rounded end swaged to 2.5 on 12 mm, with double slot bayonet (10.6 mm int. Ø), spring-loaded (5 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602906
TF6 - J type thermocouple, grounded hot junction on 6x30 mm Ø rounded end, with double slot bayonet (10.6 mm int. Ø), spring-loaded (6 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602907
TF16 - J type thermocouple, grounded hot junction on 8x12 mm Ø conical end with double slot bayonet (12.5 mm int. Ø), spring-loaded (7 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602901
TF16D6 - J type thermocouple, grounded hot junction on 6x12 mm Ø conical end with double slot bayonet (12.5 mm int. Ø), spring-loaded (6 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602902
TF4 - J type thermocouple, grounded hot junction on 8x12 mm Ø conical end with double slot bayonet (15.5 mm int. Ø), spring-loaded (7 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602904
TF4D6 - J type thermocouple, grounded hot junction on 6x12 mm Ø conical end with double slot bayonet (15.5 mm int. Ø), spring-loaded (6 x 200 mm Ø), 2 m long shielded fiberglass cable output, terminated by connection lug	P01602903

Elbowed, with rotating connector	Code
TF12 - J type thermocouple, grounded hot junction on 6 mm Ø rounded end, 32 mm sleeve, 30 mm plunge, 60 mm neck, M8 x 100 threaded connection, 2 m long shielded fiberglass cable output, terminated by connection lug	P01602908

Circular base plate, for flat surface	Code
TF13 - J type thermocouple, non-insulated hot junction, 30° inclination, h 10 x 14 mm Ø base plate, 4.2 mm int. Ø, 2 m long shielded fiberglass cable output, terminated by spade lug	P01602910
TF13 - J type thermocouple, non-insulated hot junction, 60° inclination, h 10 x 14 mm Ø base plate, 4.2 mm int. Ø, 2 m long shielded fiberglass cable output, terminated by spade lug	P01602911

Connection accessories: bayonet connection

see p. 60

Description:

- J and K type thermocouple, sheathed, in compliance with NF EN 61615 standard
Insulated hot junction
available in: simple (1TC) and duplex (2TC)
- 304L stainless steel protective sheathing for J type,
Inconel 600 protective sheathing for K type
available in: L1 length and Ø
- naked wire output, 45 mm long
- Withstands temperatures up to 750 °C for J type
and up to 1,100°C for K type
Heat resistance decreases with diameter (*see p. 6*)

RTD 100 Ω thermometer

Description:

- 1 input via miniature 3-pin female connector
- -50 °C to +200 °C measurement range; choice of °C or F
- ± 0.5 °C accuracy; 0 resolution, 1 °C
- 2,000-pixel backlit display
- Memorisation of maximum value; "Hold" function
- Comes with shockproof protective cover

Details for ordering	Code
C.A 865 RTD 100 Ω thermometer	P01.6503.01Z

Infrared thermometer and K thermocouple

Description:

- 2,000-pixel back-lit display
- Comes with shockproof protective cover

Infrared measurement, laser sighting

- -20 °C to +550 °C measurement range; choice of °C or F
- ± 2 % reading accuracy or 3 °C; 1°C Resolution
- Targeting range: D/Ø = 10/1
- Adjustable emissivity from 0.1 to 1
- 1 s response time
- High and low sound alarms
- Memorisation of maximum and minimum values

Measurement with K couple

- 1 K thermocouple input via miniature female connector
- -40 °C to +1,350 °C measurement range; choice of °C or F
- ± 0.1% reading accuracy ±1 °C; 1 °C or 0.1 °C Resolution

Details for ordering	Code
Infrared thermometer C.A 876	P01.6514.03Z

K thermocouple thermometers

Description:

- 1 K thermocouple input via miniature female connector:
C.A 861 model

- -40 °C to +1,350 °C measurement range; choice of °C or F
- ± 0.1 % reading accuracy ±1 °C
- Choice of resolution: 0.1 °C to 1 °C
- 2,000-pixel backlit display
- Memorisation of maximum value and "Hold" function
- Comes with shockproof protective cover

- 2 K thermocouple inputs via miniature female connectors:
C.A 863 model

- -50 °C to +1,300 °C measurement range; choice of °C or F
- ΔT differential temperature measurement
- ± 0.3% reading accuracy ±1 °C from -50 °C to +1,000 °C and ± 0.5 % for higher temperatures
- Choice of resolution: 0.1 °C or 1 °C
- 2,000-pixel backlit display
- "Hold" function and memorisation of maximum value
- Comes with protective shockproof cover

Pyro-Contrôle sensors

for the most demanding industries, from -268 °C to +1,700 °C

CHEMICALS, PETROCHEMICALS

These industries are characterised by highly stringent safety requirements.

Our daily business consists of manufacturing thimbles in stainless steel, nickel, PVDF, PTFE, and Hastelloy, or coated in tantalum. We can manufacture all skin thermocouples, multi-point assemblies, "i", "e" and "d" safety probes according to your requirements.

ELECTRONICS INDUSTRY

Multi-point thermocouples and spikes must be of the utmost purity. When wafers are manufactured, P and N doping and substrate oxidations will not tolerate even the slightest contamination.

METALLURGY, IRONWORKS

For the high temperatures of these industries, each sensor is adapted to the environment measured. K, S, R or B thermocouples, according to temperature range, and stainless steel, refractories, ceramic, composite or pure alumina protectors.

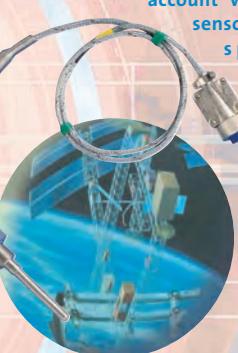

POWER AND NUCLEAR INDUSTRIES

Our KI qualified probes equip primary fluid bearings in nuclear reactors. In traditional fuel-oil or gas boilers and thermal power stations, our suction thermocouples for flame temperature measure directly at the heart of the burners' flames. Our sensors can be used for temperatures up to and exceeding 1,700 °C.

AERONAUTICS AND RAIL INDUSTRY

The extreme operating conditions - especially severe vibrations - experienced in these industries, are taken into account when defining sensors that are specifically adapted for mechanical requirements.

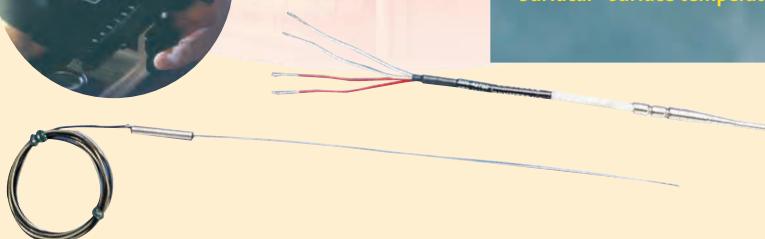

GLASS INDUSTRY

Vault and bottom thermocouple assemblies for melting furnaces and rhodium-coated platinum sheathed 3 or 5 point insertion feeder pyrometers are manufactured with the level of care appropriate for such high purity materials. Trade-in of precious metal scrap is guaranteed.

PHARMACY, AGRI-FOOD

Our sensors meet the cleanliness and materials compatibility requirements of these industries. These sensors must resist pressure and humidity in sterilizers and autoclaves.

Pyro-Contrôle calibration materials and services

• COFRAC Calibration accreditation n° 2-1385

From -20 °C to +450 °C
for RTD 100 Ω probes
and from -20 °C to +1,550 °C
for thermocouples.

- Temperature sensors
- Fixed point temperature cells
- Calibration furnaces
- Surfcal® surface temperature reference

For total control of the thermal process line

Temperature transmitters

For conditioning all temperature and process signals, a range of converters and transmitters, 1 or 2 channels, analogue or digital output, ...

Bluetooth radio modem/ RS485

Wireless communication, reliable and safe. Replaces RS485/RS232 wire connections. Bluetooth® technology.

Temperature controllers

A broad range of digital and analogue controllers, simple or elaborate models. Several formats, single or multi-input, ...

Signal transmission

Power blocks with thyristors

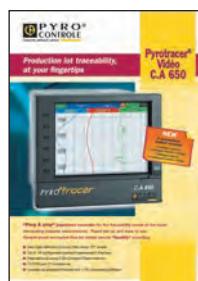

A range of thyristor power controllers, from 8 A to 2,900 A. Single or three-phase, for resistive and inductive loads. Several control and monitoring functions, ...

Signal processing

Digital panel meters

Several programmable digital panel meters for temperature and process signals. Memorisation of minimum and maximum values, ...

Recorders

Paperless model with very high definition video screen, up to 18 configurable measurement channels, PC software data processing, ...

Electric actuator

Help service

Commissioning, training, ...

Display monitoring
